Getting started

Getting started

Use the following instructions to mine a block on your blockchain

Open your wallet, and make sure you are connected to another wallet.

You are connected when you see the icon  in the lower right corner of your wallet.

The message "No block source available" will disappear once you mine your first block.

Close your wallet and create the file hancoin.conf in the folder "%APPDATA%\hancoin\".

Paste the following text into hancoin.conf and save the file.

```
addnode=node.walletbuilders.com
```

Open your wallet.

Go to Help.

Click Debug Window.

This is the console where you will execute all commands.

Type this command to start mining your first block:

```
setgenerate true -1
```

If you want to use a specific number of CPU cores, instead of -1, type the number of cores.

You can type the following command to see the status of generation.

```
getmininginfo
```

It will take about +/- 30 minutes to mine your first block, depending on your computer hardware.
